How do AI prompts work?

Asking a query

The query is analyzed by natural language understanding (NLU), a subtask of NLP.

Processing the query

The AI model scans the available data to search for relevant information by using sub-tasks such as named entity recognition (NER) and intent recognition.

Answering the query

This part uses natural language generation (NLG), where different data points, based on the question string in the prompt, are combined to generate an answer.
